Harts Range Mine

GARNET PROJECT

Harts Range Garnet reserve has the world's largest alluvial garnet deposit. It has a mine life of at least 30 years at full production

Harts Range Garnet Mine is located within four kilometres of the township of Harts Range and it's approximately two hours drive by road from Alice Springs,

Alice springs therefore operate a drive-in, drive-out operation whereby all of our workforce will be sourced from around the region and one third of the work force is made up by the indigenous community

Currently there are 3 grades of garnet being produced, 30/60, 20/40 and 20/60. These products are available in 1 tonne bulk bags or 1 tonne 25kg bags. With AMA quality assurance in place you can be confident that the grades are accurate.

Alljack & Paint are proud to be the exclusive Queensland partner of AMA Garnet

ABRASIVE RECYCLING SYSTEM

If you are blasting in a shed with garnet or slag abrasives you can save a fortune in abrasive costs by installing an abrasive recycling system. This unit is designed for use with Dura-Grit steel grit.

This abrasive can be recycled hundreds of times and will provide perfectly cleaned surfaces at the right profile height.

Average Dura - Grit consumption is only 0.5kg/m² (0.1lb/ft²).

After blasting, simply recover the abrasive into the loading hopper and the system will recycle the grit to remove all over and under sized waste.

Perfectly cleaned abrasive is deposited into 20MT storage hopper ready for reuse.

Recycle until the abrasive eventually becomes dust.

System consists of:

- Loading hopper. Recessed into floor pit, or mounted on top of floor.
- 7.5 tonne steel grit per hour bucket elevator.
- Rotary screen for removal of oversized waste.
- Airwash separator for removal of dust from good reusable abrasive.
- Abrasive storage hopper with 20 tonne steel grit capacity and butterfly outlets for 4 blast pots.
- Maintenance/adjustment ladder, platform and guard rails.
- Electrical control panel.
- Optional recovery dust collector.

VACUUM RECOVERY

EVR Vacuum Recovery Units offer the right solution for recovering and conveying of blast media. In inaccessible or enclosed areas such as storage tanks, box girder constructions, tank internals at shipyards etc., the equipment offers great savings in time and manpower. EVR Vacuum system cuts costs by reducing cleanup time and reclaiming valuable materials.

The heart of the EVR unit is the robust AERZEN German manufactured high efficiency rotary vacuum producer.

Vacuum power range 7.5 - 90kw. EVR units are configured for disposal of waste grits or recycling of reusable abrasives.

EASY-VAC RECOVERY UNIT

Easy-Vac Recovery Unit. Work site clean up of spent abrasive and waste is easily accomplished with the Easy-Vac vacuum recovery system. As the unit is fully air driven no electric power is required. This is particularly useful on work sites where sources of potential explosion ignition must be eliminated such as oil refineries, oil and gas storage depots etc.

The vacuum recovery airflow is generated by a pneumatically powered eductor pump. The eductor pump is powered by the same air supply used for blasting. The recovered abrasive, dust and debris is pneumatically conveyed through recovery vacuum hose into a fully adjustable airwash that separates good reusable abrasive from waste and dust. After collection, the abrasive is stored in a 3mt abrasive storage hopper prior to recirculating to blast pot.

Before exiting to the atmosphere the recovery airflow is passed through a 2 cartridge TDF dust collector to capture the separated dust. Waste dust is deposited into a waste collector drum prior to disposal.

The Easy-Vac is inexpensive to buy and is very simple to use and maintain as it contains no moving parts.

BLASTECHNIK BLAST ROOMS

We offer a selection of blastrooms designed and built for specific applications, including blastrooms for blasting steel fabrications, ship blocks and wind towers; blastrooms for blasting with steel abrasives, plastic media, garnet and non ferrous abrasives, as well as portable, dual abrasive and combination blast and paint rooms.

Our range of high quality, dependable and innovative blastrooms provide a fully sealed blasting enclosure to perform abrasive blasting, grit blasting, bead blasting and surface preparation and finishing operations.

DRYZA BLAST AIR TREATMENT

DryzaBlast Compressed Air Treatment Systems utilise a three stage action to remove moisture from the air. Firstly the compressed air is passed through a pre-separator to remove any water droplets. The air is then cooled through a radiator fitted with pneumatically driven fan. As the air temperature reduces the moisture vapour in the air forms liquid droplets and drops out of suspension.

The final moisture removal stage in After Cooler is through stainless steel wire wool.

DRYZABLAST MOISTURE SEPARATOR

DryzaBlast Moisture Separator is suitable as a basic last line of defence moisture trap. Compressed air enters the lower port and passes through a stainless steel wire wool filter media.

This media entraps suspended moisture particles and removes them from the air flow. Removed moisture drops to the bottom of the separator and is manually drained.

Fitted with large inlet and outlet ports the unit may also be used as a compressed air distribution receiver.
